STRENGTHS:

- Hard Worker
- Ability to meet tight deadlines
- Quick learner

Academic Project:

Title : **SHA-3(Secured Hash Algorithm)**

Environment : ASP .NET

Duration : Jan 09 – April 09

Description:

The **Secure Hash Algorithm** (SHA-3) is a new family of cryptographic hash functions. The added advantage is speed, security, simplicity and great deal of flexibility. SHA-3 is secure and its conservative design is based on the Threefish block cipher. Threefish block cipher contain 3 basic operations. That is addition, rotation and XOR functions. Unique block iteration is a chaining mode that uses Threefish to build a compression function that maps an arbitrary input size to a fixed output size. The Threefish and unique block iteration is the main function of the SHA-3.

SHA-3 is used to secure the message when the message is passing through the network. It avoids the other persons to read or write of the personal messages.
